

SCALER

Brief for your next step

Hey Rohan, good speaking with you today. You were straight about what you want -- a product company backend role in the next 9-12 months -- so I'll keep this equally straight.

Your questions answered

1

Will this actually move the needle on your interview conversion?

You said your biggest concern is whether this improves interview conversion, not just knowledge -- that is the right question to ask. Scaler's hiring network covers 900+ companies, and the program includes AI mock interviews with live avatars specifically to simulate the pressure of real product-company rounds. The 1:1 mentorship is with active industry professionals, not retired academics, so the feedback you get reflects what interviewers at product companies are actually looking for today. No program can guarantee a specific conversion rate for your profile, but the structure is built around interview readiness, not just coursework completion.

2

System design depth and real coding practice -- how serious is it?

You asked specifically about system design depth and whether the coding practice is real or surface-level -- fair concern given how many courses are thin here. The curriculum explicitly covers System Design and Backend Architecture as standalone tracks, alongside DSA topics like Dynamic Programming, Graphs, and Heaps that product companies test hard. There are 50+ hands-on projects and real-world case studies built into the program, not optional extras. For the exact module breakdown and how deep each topic goes for your batch, I would be happy to share specifics on your next call with admissions.

3

Is Rs. 3.5L worth it when you are coming from a services background?

You were honest that the fee is high and ROI matters -- so here is the math framing that makes sense for a career switcher. The gap between a mid-level Infosys role and a backend engineer at a product company is not just a salary bump; it compounds over every year after the switch. Scaler lists a median salary hike of around 110% for the DS/ML track on their website, and EMI options are available so you are not paying Rs. 3.5L upfront. The alumni network of 100,000+ also means you are buying into a peer group that has already made the services-to-product jump, which has real referral value. Scholarship eligibility and exact EMI plans for your cohort are confirmed through admissions -- happy to get you those specifics.

4

What the entrance test actually is -- and why it works in your favour

The entrance test is required before enrollment, and it gates access to your second admissions call. For someone with 4 years of IT experience like you, think of it less as a barrier and more as a filter that keeps the cohort at a level where the system design and DSA content stays challenging enough to be useful. Clearing it also confirms to you that the peer group will match your effort level -- which you said matters. Exact retake rules and prep resources are set by admissions, so I would be happy to share specifics on your next call so you know exactly what to expect.

Today

Your current compensation depends on role and city. Happy to personalize on your next call.

Target path

Stronger product and tech-facing roles depend on effort and market. We share realistic bands with admissions, not guesses.
