

SCALER

Brief for your next step

Hey Rohan, good speaking with you today. Your point about '14 LPA to 16 at another service company doesn't work'; stuck with me -- that's exactly the right way to frame this decision, and I want to give you a straight answer on each of your questions below.

Your questions answered

1

What does Scaler actually give you that Andrew Ng doesn't?

Andrew Ng is genuinely good -- no argument there. The gap isn't the content, it's everything around it: live classes 3x a week with industry instructors, 1:1 mentorship with people currently working at product companies, and 50+ hands-on projects that go on your portfolio. Coursera won't send your resume to 900+ hiring partners or put you in a room (even a virtual one) with a recruiter from a product company. You've already proven you can self-study -- your AWS cert shows that. Scaler is the structured, accountable, career-outcome layer that Coursera doesn't offer.

2

Will the salary jump actually be meaningful for someone at your level?

I'll be straight with you: I won't quote you a personal number because your outcome depends on your effort, the roles you target, and the market at the time you graduate. What I can tell you is that the DS/ML track publishes a median salary hike of ~110% on Scaler's website -- that's the only verified figure I have in front of me right now. Whether that benchmark applies to your specific profile and target roles is a real conversation, not a number I should guess at. For a breakdown that maps to a 4-YoE SDE-2 with an AWS cert targeting AI engineering roles, let's get that answered on your next call with admissions -- that's the right place for it.

3

RAG, agents, evals -- is it actually in the curriculum or just marketing?

This one I can answer directly: the curriculum explicitly includes Prompt Engineering, RAG, and Multi-agent orchestration under the AI and Agents module, plus an Agentic AI elective. It also covers Backend Architecture and System Design, which are the foundations product companies actually interview on. You said you want to build real LLM applications -- that's the stated focus of these modules, not theoretical ML. How deep the hands-on projects go and what the current cohort's project briefs look like is worth confirming on your next call, but the building blocks you named are in there.

4

The honest case for taking the entrance test

You've spent 4 years shipping real work for HDFC and Citi, you hold an AWS cert, and you're already thinking in terms of LLM applications -- you are not starting from zero. The entrance test is the gate to the second call where admissions can give you the hard placement data and cohort specifics you need to make this decision properly. Taking the test costs you an hour; it gets you the concrete answers that the first call couldn't. EMI options are available on the Rs. 3.5L fee, so the financial structure is also worth exploring there.

Today

Your current compensation depends on role and city. Happy to personalize on your next call.

Target path

Stronger product and tech-facing roles depend on effort and market. We share realistic bands with admissions, not guesses.
