Move forward — structured path to stronger product/tech roles

Hey Rohan, great speaking with you today. You were refreshingly direct — ‘I can put in effort but need confidence this is practical’; is exactly the right question to ask before committing ₹3.5L and 12 months of your life. This doc is my honest attempt to answer your four specific concerns, using only what I can actually verify about Scaler.

Your questions answered

1

Will this actually improve your interview conversion for product companies?

Your exact words were: 'My biggest concern is if this will actually improve my interview conversion.' Here's what I can honestly tell you: Scaler's program is built around the exact gap between services and product-company hiring — DSA, System Design, and Backend Architecture are all core curriculum, not electives. The 900+ hiring partners include product companies, and the 100,000+ alumni network means there are people who've made the same Infosys-to-product jump you're targeting. What I can't promise is a personal conversion rate — that depends on your effort, the roles you target, and market conditions. For actual placement stories from people with your background, I'd flag this for your next admissions call so they can pull relevant examples.

2

Is the System Design depth actually there?

You asked specifically about system design depth — and this is one area where the curriculum is explicit. System Design is a named core module, sitting alongside Backend Architecture and DSA (covering Arrays, Recursion, DP, Graphs, Heaps). This isn't a single lecture tacked on at the end — it's a pillar of the program, which makes sense given Scaler's target audience is engineers moving into exactly the kind of roles you want. How deep each module goes, and whether the pacing matches your current level (4 years, IT services background), is worth confirming on your next call — but the topic coverage is verified.

3

Is there enough real coding practice, or is it mostly theory?

You said 'real coding practice is important to me' — and this is a fair pushback on most structured programs. Scaler lists 50+ hands-on projects and real-world case studies as a core differentiator, plus AI mock interviews with live avatars for interview simulation. Live classes run 3x per week with industry instructors, not pre-recorded content you watch alone. That said, the quality of practice depends on how the projects are structured in your specific cohort — something admissions can walk you through with actual examples.

4

Is ₹3.5L worth it — honest ROI take

You were straight about it: 'Fee is high for me so ROI matters.' So let me be straight back. The only salary figure I can verify is a ~110% median salary hike for the DS/ML track (from Scaler's website) — I won't apply that number to your backend/product track because it may not hold. What I can say is: the program includes EMI options, curriculum updates at no extra cost, and is designed for the 0–7 YoE window you're in right now. The ROI question ultimately comes down to what your current CTC is, what your target CTC is, and how long it takes to land the role

— that math is worth doing on your next call with actual numbers, not estimates.

ROI snapshot · illustrative

Today (typical services background)

■ —

Your current package depends on role & city — we'll personalise this on your next call.

Target trajectory (post-upskilling)

↑ Product / tech

Outcomes vary by effort & market. We discuss realistic ranges with admissions — never a blind promise.

Career path momentum

NOW Baseline skills audit & entrance clarity

0–4 MO DSA · system building blocks · habits

4–8 MO Full stack depth · design · AI agents elective

8–12 MO Interview readiness · referrals · rounds

The entrance test is the first concrete step — it's also the best way to see how you stack up before committing anything. Take it at your own pace, and it opens the door to a second call where we can go deeper on placement data specific to your background.
