Move forward — structured path to stronger product/tech roles

Hi Rohan, thanks for the honest conversation earlier — your questions were sharp and you deserved sharper answers. This brief is our attempt to address each one directly, without the vagueness. You've already done the hard part: 4 years of real delivery experience, a VIT CSE foundation, and a self-funded AWS cert. The question now is whether Scaler is the right lever to convert that into a product-company AI role.

Your questions answered

1

Why Pay ₹3.5L When Coursera Has Andrew Ng for Free?

It's a fair challenge, and the honest answer is: free content and Scaler solve different problems. Andrew Ng's courses are excellent for concepts — but they don't hold you accountable, they don't simulate interviews, and they don't connect you to hiring managers at product companies. Structure vs. self-direction: Scaler runs live classes 3x/week with industry instructors — not recorded lectures you'll defer to next weekend. 1:1 mentorship: Active industry professionals, not forum threads. For a career switcher, this is where gaps get caught before interviews do. 50+ hands-on projects and AI mock interviews with live avatars — built for the product-company hiring bar, not just concept familiarity. 900+ hiring partners and a 100,000+ alumni network that Coursera certificates don't unlock. The real trade-off: Coursera gives you knowledge. Scaler is built to get you hired. For someone at your profile trying to break into product roles, that distinction matters more than the price difference.

2

Will the Salary Jump Actually Be Meaningful — or Just a Lateral Move?

You said it clearly: "If I'm going from 14 LPA at TCS to 16 at another service company, the math doesn't work." That's the right frame, and we won't pretend otherwise. The only figure we can cite from verified Scaler data is a ~110% median salary hike for the DS/ML track, as published on Scaler's website. We won't apply that number to your profile or your target roles — that would be misleading. What we can say honestly: your goal is a product-company AI engineering role, not just any new job. The salary outcome depends on which companies you target, how you perform in interviews, and how well you leverage the alumni network. We'd be happy to share specifics on your next call with admissions — including benchmarks for 4 YoE engineers who've made the services-to-product switch in AI roles.

3

Is the AI Curriculum Hands-On — RAG, Agents, Evals — or Mostly Theoretical?

This is where your concern is most directly addressed by what's in the curriculum. Scaler's program explicitly includes: Prompt Engineering, RAG (Retrieval-Augmented Generation), Multi-agent orchestration, Agentic AI, Elective. These are listed as curriculum highlights — not elective footnotes. The program is also structured around 50+ hands-on projects, and curriculum updates are included at no extra cost as the field evolves. On evals specifically: the exact module breakdown and project scope for your cohort is something admissions can walk through precisely. We'd be happy to share specifics on your next call so you can judge the depth yourself — not take our word for it.

4

Where You Stand — and What Makes Sense Next

Rohan, you're not too late. Four years of banking-domain delivery, an AWS cert you self-funded, and a clear target (AI engineering at product companies) puts you ahead of most people asking the same question. The risk isn't missing the AI wave — it's spending another year in the same role while the window narrows. The entrance test is your immediate next step: it gates access to the second admissions call and enrollment. Think of it as a filter that also tells you where your gaps are before you commit anything financially. EMI options are available — exact plans confirmed through admissions. Financing details, cohort peer profile, and salary benchmarks for your track: all covered on your next call. The questions you asked today are exactly the right ones. Bring them to the next call — and push for specifics.
